Examiner: J. J. Johnson Serial No: 09/824,294

Docket No.: 367-1-009

1. (Cancelled)

2. (Previously Presented) A quench box for a multi-bed, mixed-phase cocurrent downflow

fixed-bed reactor, according to claim 7, wherein the quench pipe manifold and nozzle assembly

is an annular ring pipe manifold having nozzles arising therefrom, said nozzles having nozzle

outlets located between catalyst support beams supporting the catalyst bed above the manifold

and nozzle assembly and in which the direction of flow from outlets of said nozzles is parallel

with said catalyst support beams.

3. (Original) A quench box for a multi-bed, mixed-phase cocurrent downflow fixed-bed

reactor, according to claim 2, wherein the annular ring pipe of the quench pipe manifold and

nozzle assembly is located away from the centerline of the reactor.

4. (Original) A quench box for a multi-bed, mixed-phase cocurrent downflow fixed-bed

reactor, according to claim 2, wherein each quench gas nozzle is configured such that quench

gas flowing therefrom has an exit velocity between fifteen and thirty-five feet per second.

5. (Previously presented) A quench box for a multi-bed, mixed-phase cocurrent downflow

fixed-bed reactor, according to claim 2, wherein the collection tray has ramps extending

therethrough for directing flow of a two-phase fluid stream from the collection tray into the

mixing chamber below.

Examiner: J. J. Johnson Serial No: 09/824,294

Docket No.: 367-1-009

6. (Original) A quench box for a multi-bed, mixed-phase cocurrent downflow fixed-bed

reactor, according to claim 5, wherein the ramps through the collection tray have overhead

chutes for directing vapor flow of the two-phase fluid stream from above into the mixing

chamber below.

7. (Previously presented) A quench box for a multi-bed, mixed-phase cocurrent downflow

fixed-bed reactor, comprising:

a quench pipe manifold and nozzle assembly;

a collection tray having a manway and located below the quench pipe manifold and

nozzle assembly for receiving fluid from a catalyst bed above the collection tray;

a final distributor tray for distributing fluid to a catalyst bed below the distributor tray,

said distributor tray having a manway; and

a mixing chamber located between the collection tray and the final distribution tray and

in fluid communication with the collection tray to receive a two-phase fluid stream flowing

therefrom, said mixing chamber including:

an annular compartment depending from the collection tray above and having a

partition pan and a bottom section pan,

said partition pan having a partition weir at its inside diameter over which liquid

flows onto the bottom section pan, and

said bottom section pan having a vapor outlet weir at its inside diameter, which

inside diameter is less than the inside diameter of the partition weir, for vapor flow onto

the final distributor tray below and having drip tubes extending to the final distributor

Examiner: J. J. Johnson Serial No: 09/824,294

Docket No.: 367-1-009

tray below, said drip tubes having top slots and bottom slots for directing liquid flow onto

said final distributor tray.

8. (Previously Presented) A quench box for a multi-bed, mixed-phase cocurrent downflow

fixed-bed reactor, according to claim 7, wherein the drip tubes are located generally in a ring

with a diameter of $1/\sqrt{2}$ or 0.7071 times the inside diameter of the reactor.

9. (Cancelled)

10. (Cancelled)

11. (Original) A quench box for a multi-bed, mixed-phase cocurrent downflow fixed-bed

reactor, according to claim 7, wherein the diameter of the vapor outlet weir is at least twenty-

four inches.

12. (Original) A quench box for a multi-bed, mixed-phase cocurrent downflow fixed-bed

reactor, according to claim 11, wherein the diameter of the vapor outlet weir is at least thirty

inches.

13. (Original) A quench box for a multi-bed, mixed-phase cocurrent downflow fixed-bed

reactor, according to claim 7, wherein the liquid residence time in the mixing chamber is at least

one second.

4

Examiner: J. J. Johnson Serial No: 09/824,294

Docket No.: 367-1-009

14. (Original) A quench box for a multi-bed, mixed-phase cocurrent downflow fixed-bed

reactor, according to claim 7, wherein a cylinder forms the outer circumference of the pans of

the mixing chamber having a diameter of at least $1/\sqrt{2}$ or 0.7071 times the inside diameter of the

reactor.

15. (Cancelled)

16. (Previously Presented) A quench box for a multi-bed, mixed-phase cocurrent downflow

fixed-bed reactor, according to Claim 7, wherein the mixing chamber has an open central

portion substantially aligned with the central manway in the collection tray and large enough for

a person to pass therethrough, and wherein the final distributor tray manway is a central

manway.

17. (Cancelled)
